‘Securing agile web app environments’

The scope of this engagement consisted of delivering continuous vulnerability management of 100+ web applications deployed by a online gaming/sportsbook client for their UK&I, Italian and Australian markets.

- The client company required a continuous assessment of its entire global Internet facing cyber-estate in order to detect current security issues and detect new issues into the future.
- The client required an authenticated assessment (edgescan logging into each application) to simulate an attacker with valid credentials on both desktop and mobile web applications.
- The client required a false positive free list of actionable findings which they could simply assign and fix.
- They required the assessment to continue to assess the sites so they could track progress and mitigation of discovered security risks.
- The client required access to the edgescan API and Jira plugins in order to access the edgescan data directly, system-to-system.
- The client required retest on demand capability where required and also alerting of any new high risk issues discovered.

Onboarding

The onboarding phase consisted of validating each site and server for stability and criticality such that the continuous assessment could provide coverage and depth of testing as expected. Once an application is onboarded technical assessment can commence and the application is subject to technical security assessment on an ongoing basis.

Continuous Assessment

Edgescan provided continuous authenticated assessment on an ongoing basis for the 100+ web applications under management. All of the vulnerabilities discovered are manually validated helping our client focus on issues which cause a real risk. Assessments occurred on a scheduled and an ad-hoc basis as required by the client. The assessment included the mobile sites offered by the client.

Outcome

Within the first 7 days edgescan discovered, validated and published 55 high risk issues on the clients edgescan portal. The client proceeded to fix the discovered issues over the coming months and the fixes were verified and closed by edgescan. The client could display the improvement of its security posture over time. The client could request an assessment when required to retest for vulnerabilities and maintain a secure posture.

edgescan vulnerability management features

- Progress Tracking**
Tracking your vulnerability history so you can measure your security posture and improvement over time.
- Manual Validation**
No time wasted on figuring out next steps, as all findings are verified to be real, accurate and risk rated by our security engineers.
- Awesome Reports**
Deeply customisable reporting, from executive summary to deep technical data and remediation advice.
- Time Saving**
The information you need to prioritise your security issues and help you focus your efforts – maximize your time.
- Flexibility**
Assessments – scheduled when you want them. I.e. have you changed your code base? spinned a new server?
- Robust Api**
Connect to our API and consume your local generated data to avail of our awesome graphs and reporting tools.
