

Senior Software Developer

Core Team

We are an Irish-owned cyber security company, providing world-leading Fullstack Vulnerability Management services to global customers across a wide array of industries, helping to triage their most critical security vulnerabilities.

The CORE team develops the features our users love, and have a huge impact on the efficiency of our security team through the admin-facing features we build. Our user platform has won design awards, our API gives customers broad access to their data.

Our work involves a balance of front- and back-end work, most features will touch both. You won't be working on a typical CRUD application; you'll instead have the opportunity to solve problems unique to our industry.

We care about details, we deploy often, and we place an emphasis on helping each other, whether that's pair programming, tracking down bugs, or planning features.

You Will:

- Work with a team of smart, solution-oriented developers
- Drive features from requirements to deployment
- Gain exposure to the operations side of running production servers, supported by our platform team

You may be fit for this role if you:

- Have a minimum of four years of experience in a web development role
- Have delivered production systems
- Write high quality code. We work mostly in Ruby, but we recognise that general engineering skill is independent of language and frameworks. We're happy to support candidates while they learn.
- Have strong communication skills
- Are comfortable being given autonomy over how you approach feature development

Nice to haves:

- Experience with Ruby on Rails or React
- Experience mentoring Junior team members
- Familiarity with AWS, Docker
- Familiarity with prototyping processes and interfaces (e.g. Figma)
- Basic knowledge of database operation and administration

What's it like to work at edgescan?

We've built a team with a strong focus on autonomy, collaboration, knowledge sharing, and above all: code quality.

Our leadership understand that development is a creative activity and strive to keep things relaxed so you can focus on what's important.

We encourage knowledge sharing through collaboration, and emphasize collective responsibility for the team's operations.
