

Senior Software Developer

Scan Team

We are an Irish-owned cyber security company, providing world-leading Fullstack Vulnerability Management services to global customers across a wide array of industries, helping to triage their most critical security vulnerabilities.

Edgescan's scanning processes form the beating heart of our business model. The Scan team is responsible for the accuracy, stability, and efficiency of these processes. Our work is predominantly backend focused; most of our applications are written in Ruby and Rails.

We solve complex problems and create innovative solutions to enhance our suite vulnerability scanning tools targeting both networks and web applications. We work closely with the edgescan Security Operations team to ensure these tools maintain an exceptional level of quality.

We place a strong emphasis on knowledge sharing. Responsibility for our frequent deploys is shared amongst team members and input into feature design and planning is encouraged.

You will:

- Work with a team of smart, solution-oriented developers
- Learn about vulnerability detection and remediation from security experts
- Build systems that can scan hundreds of web applications and thousands of hosts concurrently, and scale far beyond that on demand
- Gain exposure to the operations side of running production servers, supported by our platform team

You may be fit for this role if you:

- Have a minimum of four years of experience in a software development role
- Write high quality code. We work mostly in Ruby, but we recognise that general engineering skill is independent of language and frameworks. We're happy to support candidates while they learn
- Have strong communication skills
- Have experience writing, debugging and profiling high performance code
- Are comfortable being given autonomy over how you approach feature development

Nice to have:

- Familiarity with common security vulnerabilities and how they can be exploited
- Experience mentoring Junior team members
- Familiarity with AWS, Docker
- Knowledge of database operation and administration

What's it like to work at edgescan?

We've built a team with a strong focus on autonomy, collaboration, knowledge sharing and above all, code quality.

Our leadership understand that development is a creative activity and strive to keep things relaxed so you can focus on what's important.

We encourage knowledge sharing through collaboration, and emphasize collective responsibility for the teams operations.
